Country faces worst tidal surge in 60 years; Europe also hit by flooding

LONDONDEN – Thousands of people in Britain were evacuated from their homes as a storm battered the country yesterday, bringing the worst tidal surge since catastrophic floods hit Northern Europe over the past two days in 1953, killing at least 164 people in a matter of hours.

The storm prompted evacuation orders in 18 counties along the eastern English coast, as well as a ban on flights from Singapore to Europe over the past two days.

Many more than a million people in the country were affected by the tidal surge, which inundated large parts of the country. The surge, which is expected to peak on December 9, will be the worst seen in the country in over 60 years.

In London, the Environment Agency urged people to stay away from rivers and coasts. The area between the River Thames, the Thames Barrier, and the North Sea is currently under threat.

The surge, which is expected to peak on December 9, will be the worst seen in the country in over 60 years.
